

Title

Brainstorming and Idea Prioritization – SB Stocks

Introduction

Brainstorming is an important stage in the development of a software solution. It helps identify real-world problems, explore multiple possible solutions, and select an idea based on feasibility, usefulness, and technical implementation.

During the brainstorming phase of the SB Stocks project, various problems related to financial education, stock market learning, investment practice, and portfolio management were considered.

The primary objective was to develop a solution that enables users to understand stock trading concepts without exposing them to actual financial risk.

Brainstorming Ideas

The following ideas were considered during the brainstorming process:

1. Personal Expense Tracker

A web application that enables users to record daily expenses, categorize spending, and analyze monthly financial habits.

2. Investment Learning Platform

An educational platform containing basic information about stocks, investment terminology, and financial markets.

3. Stock Market Analysis Dashboard

A dashboard that displays stock information, historical trends, and market performance using graphical representations.

4. Virtual Stock Trading Platform

A paper trading platform where users can use virtual funds to buy and sell stocks, maintain portfolios, and analyze trading performance.

5. Trading Strategy Analysis Platform

A system that enables users to apply simple trading strategies to historical stock data and compare strategy performance.

Idea Prioritization

The ideas were evaluated based on the following parameters:

Idea	User Value	Technical Feasibility	Learning Scope	Innovation
Expense Tracker	Medium	High	Medium	Low
Investment Learning Platform	Medium	High	Medium	Medium
Stock Analysis Dashboard	High	Medium	High	Medium
Virtual Stock Trading Platform	High	High	High	High
Strategy Analysis Platform	High	Medium	High	High

Based on the evaluation, the **Virtual Stock Trading Platform** was selected as the primary solution.

The concept was further enhanced by including historical stock analysis, portfolio management, transaction tracking, and strategy testing.

Selected Idea

The selected idea is **SB Stocks – A Virtual Stock Market and Paper Trading Platform**.

SB Stocks provides users with a risk-free environment to explore stocks and practice stock trading using virtual funds. Users can create accounts, manage virtual portfolios, browse stocks, analyze historical stock data, simulate buy and sell transactions, and track portfolio performance.

The system also maintains transaction and order records to provide users with a clear history of their trading activities.

Reason for Selecting the Idea

The idea was selected because beginners often find it difficult to understand stock market operations without investing real money.

Direct participation in financial markets may involve financial risk. A virtual trading environment provides users with an opportunity to understand stock transactions and portfolio management through practical simulation.

The project also provides significant technical learning opportunities by integrating frontend development, backend REST APIs, database management, authentication, data visualization, and financial calculations.

Conclusion

The brainstorming and idea prioritization process resulted in the selection of SB Stocks. The proposed system combines financial learning with practical stock trading simulation and provides a structured environment for users to understand basic market operations.
